# BACHELOR THESIS

### CALA – Heavy-lon Acceleration for Nuclear Astrophysics

To strengthen our experimental team at the Centre for Advanced Laser Applications (CALA) at the Forschungszentrum Garching near Munich we are currently looking for a talented and motivated

# **Bachelor Student**

In the framework of your thesis, you will be responsible for:

- First tests of an in-vacuum target foil heating setup using a dedicated heating laser and IR spectrometer
- Characterization and optimization of heating parameters and target temperature
- Analysis of data collected with the heating setup

Furthermore, you will be given the chance to participate in beamtimes, getting hands-on experience in operating the experimental device controls and diagnostics.

Vivid interest in laser particle acceleration, optics and laser physics is beneficial. Knowledge in programming with Python is desirable. Enjoyment of experimental work is major prerequisite.

If we caught your attention, we would be happy to receive your application including a short cover letter, your transcript of records and your CV to the email address listed below. You are always very welcome to visit us in Garching for a lab tour. We are excited to meet you!

#### Laser-driven Heavy Ion Acceleration

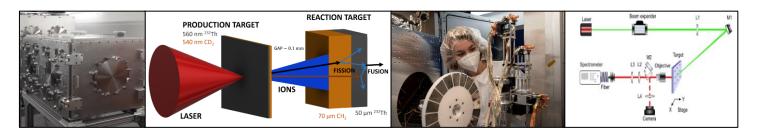

Laser-driven ion acceleration has been an emerging research field since its first realization about two decades ago. The ion bunches, accelerated by the interaction of ultra-intense laser pulses with plasmas, exhibit unique features, promising applications in various fields of physics.

Our group aims at the development of laser-driven bunches of *heavy* ions (gold, lead, thorium) as preparation for a novel reaction mechanism ('fission-fusion') in order to generate extremely neutron-rich isotopes relevant for nuclear astrophysics.

In order to enhance the efficient acceleration of heavy ions the target is heated to evaporate surface contaminants. A setup to heat the target and measure its temperature via IR spectroscopy already exists and now needs to be implemented into the vacuum system.

## CALA

The Centre for Advanced Laser Applications (CALA) is home to one of the world's most powerful laser systems, the ATLAS-3000 laser, with a maximum power of up to 3 PW, delivered in ultra-short pulses of 25 fs.
